## 1. INTRODUCTION

### **Project Overview:**

Project is based on Retail Store Stock Inventory analytics which is used to supply the stocks for shops based on their needs. By managing inventory, retailers meet customer demand without running out of stock or carrying excess supply.

Inventory management is vital for retailers because the practice helps them increase profits. They are more likely to have enough inventory to capture every possible sale while avoiding overstock and minimizing expenses.

### **Purpose:**

Purpose of retail store stock analysis is to find the necessary stock required for to supply customer when there are in need of, the shop holder view the stock, price and sale in form dashboard, report and story in webpage which helps them to track regularly the status of their stock availability.

It helps in managing the current stock levels, ordered items and products as well as ones already sold. It provides a constant supply of products to fulfill customer demand. It allows customer retention. Customers convert into loyal customers by handling stock levels.

## 2. LITERATURE SURVEY

### **Existing problem:**

Existing system consist of methods using ABC Analysis and Min-Max Analysis. In the Data Mart, the search for goods classes per sub category is carried out using the ABC Analysis calculation method. Furthermore, in the Data Mart, the search for maximum and minimum stock values is based on the Min-Max Analysis calculation method. The resulting maximum and minimum grade and stock values are then implemented into the goods

data table in the retail management information system database. The last stage is to arrange the order amount that is allowed in the order module in the retail management information system. Rules that are made based on the class of goods along with the minimum and maximum stock values.

### **Problem Statement Definition:**

The shop holder sell the product as requested by the consumer at the time when the stock is not available it will reduce customer satisfaction and it isalso a loss for the seller.

In order to overcome this drawback we using visualization to represent stocks availability and sale. Therefore quality and quantity of product can be delivered without any demand.

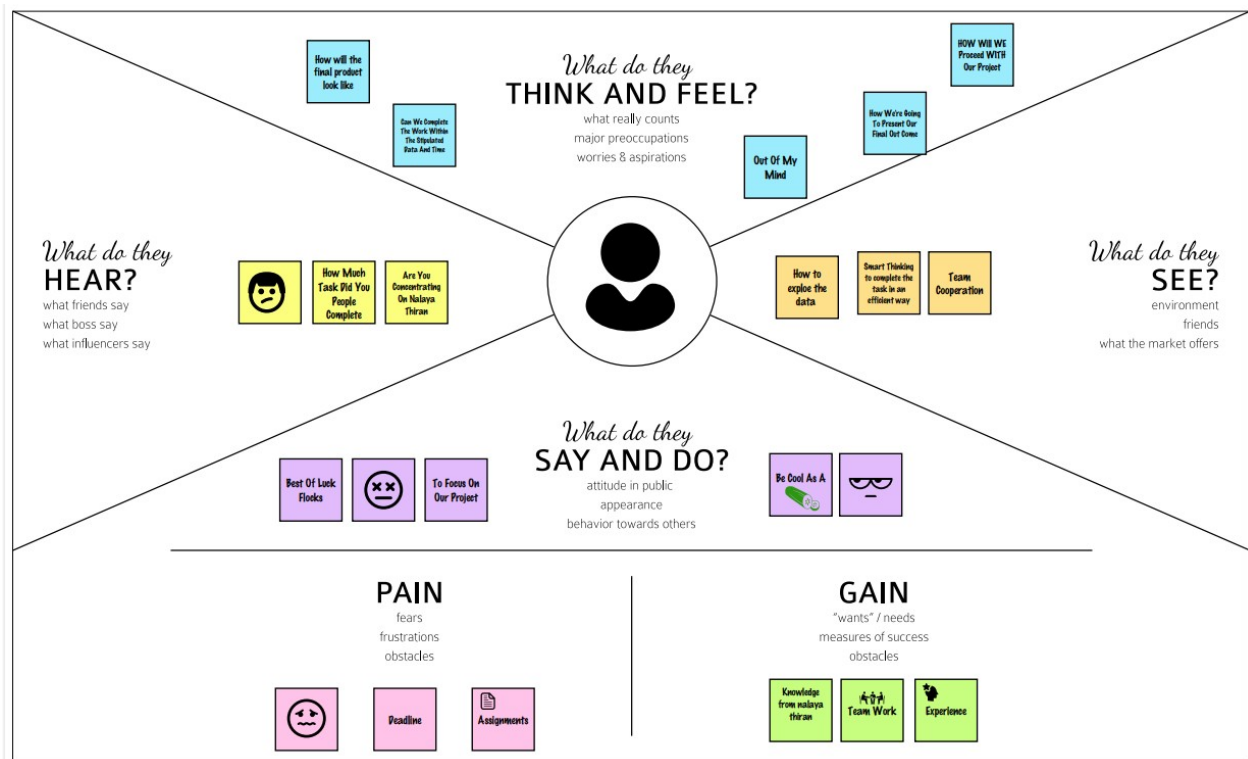

<b>Problem Statement (PS)</b>	<b>I am (Customer)</b>	<b>I’m trying to</b>	<b>But</b>	<b>Because</b>	<b>Which makes me feel</b>
PS-1	A Shopaholic	Buy my favourite products	Most of the products are not available in store	But the demand for the product is high	Unsatisfied
PS-2	A Foodie	Buy my favourite chocolate	It is not available in any stores	It is imported chocolates	Frustrated

**Problem Statement-1:****Problem Statement-2:****3. IDEATION & PROPOSED SOLUTION****Empathy Map Canvas:**

An empathy map is a collaborative tool teams can use to gain a deeper insight into their customers. Much like a user persona, an empathy map can represent a group of users, such as a customer segment.

An Empathy Map consists of four quadrants. The four quadrants reflect four key traits, which the user demonstrated/possessed during the observation/research stage. The four quadrants refer to what the user:

Said, Did, Thought, and Felt. It's fairly easy to determine what the user said and did.

### Ideation & Brainstorming:

Brainstorming provides a free and open environment that encourages everyone within a team to participate in the creative thinking process that leads to problem solving. Prioritizing volume over value, out-of-the-box ideas are welcome and built upon, and all participants are encouraged to collaborate, helping each other develop a rich amount of creative solutions.

## Step-1: Team Gathering, Collaboration and Select the Problem Statement

**Template**

## Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

🕒 10 minutes to prepare  
🕒 1 hour to collaborate  
👤 2-8 people recommended

### Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

🕒 10 minutes

- A Team gathering**  
Define who should participate in the session and send an invite. Share relevant information or pre-work ahead.
- B Set the goal**  
Think about the problem you'll be focusing on solving in the brainstorming session.
- C Learn how to use the facilitation tools**  
Use the Facilitation Superpowers to run a happy and productive session.

[Open article](#) →

### 1 Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

🕒 5 minutes

The seller sells the product as requested by the consumer, at the time when the stock is not available it will reduce customer satisfaction and it is also a loss for the seller. In order to overcome this drawback we are using dashboard which represents stocks data and expiry date alert. Therefore quality and quantity products will be available in the market.

**PROBLEM**  
How might we [your problem statement]?

#### Key rules of brainstorming

To run a smooth and productive session

- Stay in topic.
- Encourage wild ideas.
- Defer judgment.
- Listen to others.
- Go for volume.
- If possible, be visual.

## Step-2: Brainstorm, Idea Listing and Grouping

### 2 Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

**TIP**

You can select a sticky note and hit the pencil (switch to sketch) icon to start drawing!

**SAGGY S**

### 3 Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

## Step-3: Idea Prioritization

4

**Prioritize**

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

⌚ 20 minutes

**Proposed Solution:**

Proposed Solution means the technical solution to be provided by the Implementation agency in response to the requirements and the objectives of the Project.

The main goal of presenting a business proposal is to provide solution to a problem faced by a potential buyer. This section should be as comprehensive as possible, and able to address all the needs that you have pointed in the first section.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Customers gets disappointed when the store does not meets the satisfaction level of them.
2.	Idea / Solution description	Using dashboard it would become easy for the store to keep a track on their stock, sothat they can meet customer's satisfaction level.
3.	Novelty / Uniqueness	Expiry alert of the product will be given.
4.	Social Impact / Customer Satisfaction	Quality and Quantity of the product can maintained to the best, and customer's will have a heart full feeling while leaving the store.
5.	Business Model (Revenue Model)	Using this method the company will have reputed customers and stocks will be delivered on time,so there is no need of last minute hassle.

6.	Scalability of the Solution	When your inventory is hard to identify or locate in the warehouse, it leads to incomplete, inaccurate or delayed shipments. Receiving and finding the right stock is vital to efficient warehouse operations and provides a positive customer experiences.
----	-----------------------------	---

**Problem Solution fit:**

Problem-Solution Fit simply means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem. The Problem-Solution Fit is an important step towards the Product-Market Fit, but often an underestimated one.

Problem-Solution canvas is a tool for entrepreneurs, marketers and corporate innovators, which helps them identify solutions with higher chances for solution adoption, reduce time spent on solution testing and get a better overview of current situation.

Define CS, fit into CC	<b>1. CUSTOMER SEGMENT(S)</b> <span>CS</span> Who is your customer? Shopkeeper's who are in need for buying products to refill their stocks.	<b>6. CUSTOMER CONSTRAINTS</b> What constraints prevent your customers from taking action or limit their choices of solutions? As personal computer won't be available to everyone and most of the people won't be knowing the technology that they are using, even if they have to allot a person in charge they have to pay for them, so they are worried to go for.	<b>5. AVAILABLE SOLUTIONS</b> <span>AS</span> Which solutions are available to the customer when they face the problem or need to get the job done? what have they tried in the past? Customers assign a managing assistant to over view the stock	Explore AS, differentiate
	<b>2. JOBS-TO-BE-DONE / PROBLEMS</b> <span>J&amp;P</span> Which jobs-to-be-done (or problems) do you address for your customers? Shopkeeper will be able to see the products which they need to buy based on the availability and also they get to know about the product expiry date so that they could dispose them in advance.	<b>9. PROBLEM ROOT CAUSE</b> <span>RC</span> What is the real reason that this problem exists? What is the back story behind the need to do this job? Most of the shopkeepers lose their customers because of insufficient stock and proper stock management. So they face loss in their business. In order to help them with their profit we are helping them with technology to make it easy.	<b>7. BEHAVIOUR</b> <span>BE</span> What does your customer do to address the problem and get the job done? They will seek a software engineer and explain all the requirements to be put in the dashboard and learn in and out of the dashboard and know what profit would they make out of that and implement it.	
Focus on J&P, tap into BE, understand RC	<b>3. TRIGGERS</b> <span>TR</span> What triggers customers to act? We will be showing our products through dashboard which makes the shopkeeper to trigger.	<b>10. YOUR SOLUTION</b> <span>SL</span> We are working on a new business proposition, where the shopkeeper can view the products availability in form of dashboard and buy product based on their need which saves time for them. Expiry date is displayed which helps shopkeeper to provide quantity and quality product to customer.	<b>8. CHANNELS of BEHAVIOUR</b> <span>CH</span> <b>8.1 ONLINE</b> They learn how to make use of new technologies and how do they get profited out of it  <b>8.2 OFFLINE</b> What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development. They will apply the sources in the real time whatever they learnt.	Focus on J&P, tap into BE, understand RC
	<b>4. EMOTIONS: BEFORE / AFTER</b> <span>EM</span> How do customers feel when they face a problem or a job and afterwards? The shopkeeper visits the warehouse directly and check the availability of the product where by using the dashboard there is no need to visit the warehouse rather they get view the details of the product and the availability in their dashboard itself which saves their time.			
Identify strong TR & EM				Identify strong TR & EM

## 4. REQUIREMENT ANALYSIS

### Functional requirement:

Functional requirements may involve calculations, technical details, data manipulation and processing, and other specific functionality that define what a system is supposed to accomplish. Behavioral requirements describe all the cases where the system uses the functional requirements, these are captured in use cases.

Functional requirements drive the application architecture of a system, while non-functional requirements drive the technical architecture of a system.

<b>FR No.</b>	<b>Functional Requirement (Epic)</b>	<b>Sub Requirement (Story / Sub-Task)</b>
FR-1	User Registration	Registration through webpage
FR-2	User Login	Login through webpage
FR-3	User Stock List	View in the webpage
FR-4	Sales List	View in the webpage
FR-5	Revenue Detail	View in the webpage

#### **Non-Functional requirements:**

Non-functional requirements are often mistakenly called the "quality attributes" of a system, however there is a distinction between the two. Non-functional requirements are the criteria for evaluating how a software system should perform and a software system must have certain quality attributes in order to meet non-functional requirements.

<b>FR No.</b>	<b>Non-Functional Requirement</b>	<b>Description</b>
NFR-1	<b>Usability</b>	Clear view about Stock Details which provides benefit to the users.
NFR-2	<b>Security</b>	Only authorized users can log in to view that provide security to the users.

NFR-3	<b>Reliability</b>	Information about one store cannot be viewed by the other
		store users.
NFR-4	<b>Performance</b>	Available and required amount of stock can be viewed in dashboard by visualization hence the user can make decision according to it.
NFR-5	<b>Availability</b>	Visualization shows the stock availability and the products which need to be refilled can be viewed that prevent user from last minute shortage.
NFR-6	<b>Scalability</b>	Product expiry date can be viewed which helps the user to sell those product in prior that provides benefits to the shop owner.

## 5. PROJECT DESIGN

### Data Flow Diagrams:

A data-flow diagram is a way of representing a flow of data through a process or a system. The DFD also provides information about the outputs and inputs of each entity and the process itself. A data-flow diagram has no control flow — there are no decision rules and no loops.

**FIRST LEVEL DATA FLOW DIAGRAM**

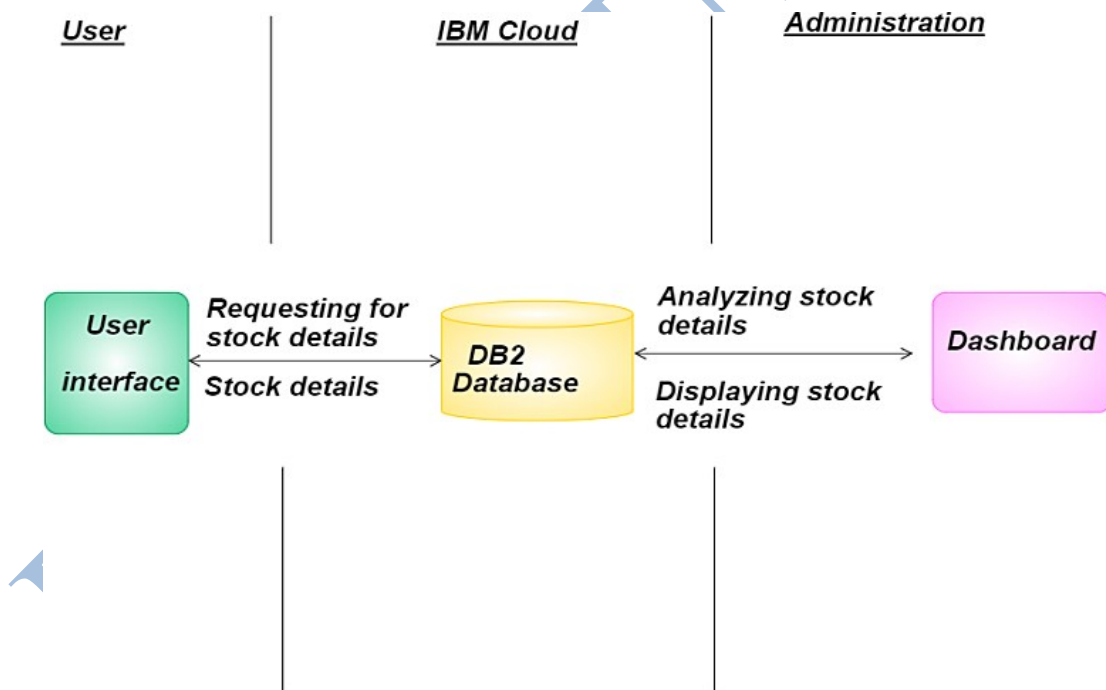

### **Solution & Technical Architecture:**

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Technical Architecture (TA) is a form of IT architecture that is used to design computer systems. It involves the development of a technical blueprint with regard to the arrangement, interaction, and interdependence of all elements so that system-relevant requirements are met.

## User Stories:

A user story is an informal, general explanation of a software feature written from the perspective of the end user or customer. The purpose of a user story is to articulate how a piece of work will deliver a particular value back to the customer.

In software development and product management, a user story is an informal, natural language description of features of a software system.

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password.	2	Medium	Suchitra Ramaraj, Ragavi.S
Sprint-1	Login	USN-2	As a user, I can log into the application by entering username & password.	2	Medium	Varshetha.M, Sharon Shamitha.S
Sprint-2	Data Upload	USN-3	As a user, I can upload my data so that I can have a visual representation of it.	1	Low	Ragavi.S
Sprint-2	Dashboard Creation	USN-4	As a user, I can view the visual representation of my data in dashboard.	3	High	Rathnaa.S, Suchitra Ramaraj
Sprint-3	Report Creation	USN-5	As a user, I can view the visual representation of my data in report.	3	High	Varshetha.M, Sharon Shamitha.S
Sprint-4	Story Creation	USN-6	As a user, I can view the visual representation of my data in story.	3	High	Ragavi.S, Rathnaa.S

## 6. PROJECT PLANNING & SCHEDULING

### Sprint Planning & Estimation:

In Scrum Projects, Estimation is done by the entire team during Sprint Planning Meeting. The objective of the Estimation would be to consider the User Stories for the Sprint by Priority and by the Ability of the team to deliver during the Time Box of the Sprint.

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	30 Oct 2022	20	30 Oct 2022
Sprint-2	20	6 Days	31 Oct 2022	06 Nov 2022	20	06 Nov 2022
Sprint-3	20	6 Days	06 Nov 2022	13 Nov 2022	20	13 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

### **Sprint Delivery Schedule:**

In Scrum project sprint delivery schedule is used to estimate when sprint has started and delivery date of the sprint. Due to estimation of the sprint delivery schedule it helps the developer to complete their project within the estimated time.

### **Reports from JIRA:**

The reports in JIRA have been denoted below:

### **BACKLOG:**

Backlog is usually a list of issues describing what your team is going to do on a project. It's a convenient place for creating, storing, and managing several kinds of issues: issues that you're currently working on (you can also see them on the board and in the current sprint if you're using a Scrum project).

## 8. TESTING

### Test Case:

- Verifies whether the user can login if he/she was an registered user.
- Verifies whether an unregistered user cannot proceed with the login.
- Verifies whether an unregistered user can successfully register as a user.
- Verifies whether an register user cannot register them self as a new user.
- Verifies whether an alert message popup when an unregistered user tries to login .
- Verifies whether an alert message popup when an registered user tries to register again.
- Verifies whether an alert message popup when an registered user enters his/her username or password incorrect.
- Verifies whether an alert message popup when an new user registers.
- Verifies whether all UI button(signup,login now,logout,report,story,user dashboard) works efficiently.
- Verifies whether username popup on the welcome note.

Test case ID	Feature Type	Component	Test Scenario	Pre-Requisite	Steps To Execute	Test Data	Expected Result	Actual Result	Status	Comments	TC for Automation Y/N	BUG ID	Executed By
Testcase_1	Functional	Login Page	Verifies whether the user can login if he/she was an registered user	Checks whether the logged in username is registered in backend.	1.Enter your username 2.Enter your password 3.click signin button	username: Nalajin Thirina password:abcd	Homepage should display	Working as expected	Pass				user
Testcase_2	Functional	Login Page	Verifies whether an unregistered user cannot proceed with the login.	Checks whether the logged in username is not registered in backend.	1.Enter your username 2.Enter your password 3.click signin button	username: nalajin thirina password:1234	Homepage will not display	Working as expected	pass				user
testcase_3	Functional	register page	Verifies whether an unregistered user can successfully register as a user.	The details given by the user is stored in backend	1.Enter your username 2.Enter your email 3.Enter your password 4.Enter your confirm password 5.Click on signup button	Enter your data	User will be able to access to login page	working as expected	pass				user
testcase_4	Functional	Register page	Verifies whether an register user cannot register themselves as a new user.	checks whether the user name is present in the database.	1.Enter your username 2.Enter your email 3.Enter your password 4.Enter your confirm password 5.Click on signup button	username: Nalajin Thirina password:abcd	User will not be able to access to login page	working as expected	pass				user
Testcase_5	Functional	Login page	Verifies whether an alert message popup when an unregistered user tries to login	checks whether the user name is present in the database.	1.Enter your username 2.Enter your password 3.click signin button	username:raj password:abcd	message should display	Working as expected	Pass				user

Testcase_6	Functional	Register page	Verifies whether an alert message popup when an registered user tries to register again.	checks whether the user name is present in the database.	1.Enter your username 2.Enter your email 3.Enter your password 4.Enter your confirm password 5.Click on signup button	Username:Nalysia Thirina password: abcd	message should display	Working as expected	Pass				user
Testcase_7	Functional	Login page	Verifies whether an alert message popup when an registered user enters his/her username or password incorrect.	checks the username given by the user against the username and password in the database.	1.Enter your username 2.Enter your password 3.click login button	Username:Nalysia Thirina password: 1234	user will not be able to access the home page	working as expected	Pass				user
Testcase_8	Functional	Register page	Verifies whether an alert message popup when an new user registers.	checks whether the username and password is uploaded in the database.	1.Enter your username 2.Enter your email 3.Enter your password 4.Enter your confirm password 5.Click on signup button	Username:Nalysia Thirina password: 1234	message should display	Working as expected	Pass				user
Testcase_9	UI	Home page	Verifies whether all UI buttons(signup,login,logout,report,story,user dashboard) works efficiently.	checks whether all the buttons are working efficiently	1.Enter username, password to login 2.Click on report, story,user dashboard and logout button		buttons should work	Working as expected	Pass				user
Testcase_10	Functional	Home page	Verifies whether username popup on the welcome note.	check whether the message display	1.Enter your username 2.Enter your password 3.click login button		welcome note should display	Working as expected	Pass				user

## User Acceptance Testing:

The purpose of this is to briefly explain the test coverage and open issues of the retail store stock analytics project at the time of the release to User Acceptance Testing (UAT).

### Defect Analysis:

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved.

Resolution	Severity1	Severity2	Severity3	Severity4	Subtotal
By Design	8	4	2	1	15
Duplicate	0	0	0	0	0
External	3	2	0	1	6
Fixed	4	0	1	0	5
Not Reproduced	0	0	1	0	1
Skipped	0	0	0	1	1
Won't Fix	0	0	1	0	1
Totals	15	6	5	3	29

### Test Case Analysis:

This report shows the number of test cases that have passed, failed, and untested

Section	Total Cases	Not Tested	Fail	Pass
Print Engine	5	0	0	5
Client Application	30	0	0	30
Security	2	0	0	2
Outsource Shipping	4	0	0	4
Exception Reporting	8	0	0	8
Final Report Output	6	0	0	6
Version Control	2	0	0	2

## 9. RESULTS

### Performance Metrics:

Performance metrics are defined as figures and data representative of an organization's actions, abilities, and overall quality.

S.No.	Parameter	Screenshot / Values
1.	Dashboard design	Dashboard consist of 8graph in 8 different tabs.
2.	Data Responsiveness	Data was responsive for creating dashboard,story and report.
3.	Amount Data to Rendered (DB2 Metrics)	Inventory management dataset which consist of 938 datas in it.
4.	Utilization of Data Filters	Data filters was used to find the top most of the data in form of visualization.
5.	Effective User Story	Story consist of 4 scenes and 5 graphs.
6.	Descriptive Reports	Created 2 reports with 7 graphs.

## 10. ADVANTAGES & DISADVANTAGES:

### Advantage:

- > An advantage of the retail inventory method is that it does not require a physical inventory.
- > The retail inventory method only requires an organization to record the retail prices of inventory items.

### Cost-Effective:

Manual inventory control would increase your labor and process costs.

### Saves Time:

Paper-based retail inventory management can take a lot of time and effort.

### Process Efficiency:

Inventory management is one of the crucial retail processes.

### Disadvantage:

- > Overstocking on products runs the risk of the product becoming obsolete.
- > Higher storage and insurance costs.
- > Certain goods might perish.
- > Stock may become obsolete before it is used.
- > Your capital is tied up

## 11. CONCLUSION:

Hence in Retail store stock analysis it helps shop holder to manage stock, sale and price and maintain the necessary stock without reaching to demand, by maintaining the stock it gains the trust for the customer to buy product on a regular basis which also provide gain to to shop holder by increasing the profit.

## 12. FUTURE SCOPE:

Inventory management systems have become more real-time, giving retailers more data about demographics, spending habits, shopping preferences, etc.. Stock control for omni channel retailing. Stores doing omni channel retailing

are at the top of their game; they attract the 90% of consumers who switch between at least three applications per day to complete specific tasks. Inventories that power experiential retail.
